

## THE BOSTON HMDA DATA SET

The Boston HMDA data set was collected by researchers at the Federal Reserve Bank of Boston. The data set combines information from mortgage applications and a follow-up survey of the banks and other lending institutions that received these mortgage applications. The data pertain to mortgage applications made in 1990 in the greater Boston metropolitan area. The full data set has 2925 observations, consisting of all mortgage applications by blacks and Hispanics plus a random sample of mortgage applications by whites.

To narrow the scope of the analysis in this chapter, we use a subset of the data for single-family residences only (thereby excluding data on multi-family homes) and for black and white applicants only (thereby excluding data on applicants from other minority groups). This leaves 2380 observations. Definitions of the variables used in this chapter are given in Table 9.1.

These data were graciously provided to us by Geoffrey Tootell of the Research Department of the Federal Reserve Bank of Boston. More information about this data set, along with the conclusions reached by the Federal Reserve Bank of Boston researchers, is available in the article by Alicia H. Munnell, Geoffrey M.B. Tootell, Lynne E. Browne, and James McEneaney, “Mortgage Lending in Boston: Interpreting HMDA Data,” *American Economic Review*, 1996, pp. 25 – 53.

Two datasets have been included on the website. HMDA\_AER is the full HMDA data set used in the Munnell, Tootell, Browne and McEneaney paper. HMDA\_SW is contains the 2380 observations that are used in the analysis in Chapter 9.

The description of the data set given below was supplied by the Federal Reserve Bank of Boston.
